One signal engine. Two proposed risk envelopes.

Bruce Tech reference: Manifest MX5. The confluence gate and named envelopes are not implemented in Meridian.

PROPOSED / NON-AI SIGNAL RULES + RISK POLICY

Halt thresholds are policy triggers, not loss guarantees.

PROPOSED CONFLUENCE DESIGN | NON-AI

Tension
Stretch from equilibrium
Definition to be validated

Momentum
Directional acceleration
Definition to be validated

Structure
Recent price-path shape
Definition to be validated

Signal agreement gate | NON-AI proposal
Require the defined readings to agree before a new entry.
No agreement: no new entry. Existing-position exits need a separate rule.

One portfolio decision | NON-AI proposal
This would change or gate the current signals; it requires separate validation.

Safe Harbor | 7% halt
Proposed drawdown-triggered halt
Soft threshold must be below 7%

Ride the Waves | 15% halt
Proposed drawdown-triggered halt
Account state and reset policy required

These envelopes are risk profiles. Instruments are a separate asset universe.

CURRENT MERIDIAN / IMPLEMENTED

Weighted ensemble | NON-AI
Trend + momentum + mean reversion
No tension/structure agreement gate

Fund risk | NON-AI
12% soft / 25% hard drawdown
7% / 15% named profiles are not configured

Advisory roles | AI-READY
Code-based analyst and Chair reviews
Automatic LLM calls are not connected

Before implementation
Define metrics, timeframe and agreement rule.
Select fund or sleeve NAV for each halt.
Validate costs, exits, holdings and reset rules.

Reference concept added. Trading code and current risk limits are unchanged.

DESIGN ONLY

Design source: https://bruce-tech.com/ | Manifest MX5, Safe Harbor and Ride the Waves are Bruce Tech reference names.
